COMPANY & SOLUTIONS · NOVEMBER 2026

Hi-Tech-Fx: MT4 Server and Brokerage Software Solutions Since 2011

A company overview: MT4 Server rental, turnkey purchase, management tools and separately available brokerage technology.

A focused supplier for brokerage technology

Hi-Tech-Fx presents itself as a provider of MT4 Server and related brokerage software solutions, active in this market since **2011**. Its service model covers rental, turnkey purchases, selected hosting locations, initial server setup and optional infrastructure components. The offering is designed for technically capable businesses that want to administer trading accounts or build their own client-facing brokerage environment.

The company does not present a basic server subscription as a ready-made regulated brokerage. Technology delivery, legal permissions, payment systems and the business's own market relationships remain distinct responsibilities that must be assigned explicitly.

MT4 Server rental: start with a working environment

The rental route is built around a provider-hosted MT4 Server environment. According to the published Hi-Tech-Fx offer, a customer can receive initial configuration, account-group and symbol setup, access through MT4 Administrator and MT4 Manager, and agreed connectivity. The company advertises a base rental rate of **0.000365 BTC per day** in November 2026, with a minimum term of **10 days** and discounts for selected prepaid periods. Web, mobile, brokerage portal and other modules are quoted separately unless stated otherwise.

For a team that wants to verify requirements before committing to independent hosting, rental can serve as a practical first stage.

Turnkey purchase and the scope of handover

Hi-Tech-Fx also offers the purchase of an agreed MT4 Server configuration for customers seeking independent technical operation. The specific deliverables, installation location, software terms, updates, optional branding and integration requirements are determined by the commercial specification. Purchase should be evaluated on the exact handover scope, rather than on broad slogans about “owning everything”.

An in-house development team can extend a project with custom applications or integrations subject to available interfaces, technical constraints and software usage rights. Branding and any additional tools for modifying server or client components must be separately agreed when they are not part of the base purchase.

A modular portfolio, not a compulsory bundle

The company's product categories include: MT4 Server and hosting; MT4 Administrator/Manager access; Web and Mobile Terminal solutions; White Label and branding; Web/API and website integration; Broker Portal, Client Area and IB structures; quote-feed connectivity; liquidity or execution bridges; operational Back Office; monitoring, risk controls and custom server plugins. Some components are implementation projects rather than off-the-shelf functions.

This modular approach is useful to buyers who already have their own CRM, client applications or developers. They can specify the MT4 Server itself and request a separate quotation for only the extra parts they need.

First see the software, then test full administration

Hi-Tech-Fx provides public links to introductory MT4 client interfaces and a browser terminal. Introductory access uses limited permissions; investor access is suitable for observing the terminal but not for placing trades. For customers evaluating rental or purchase, the standard paid **72-hour full-access test** is quoted at **0.005477 BTC** as of November 2026. It includes a prepared server environment in a selected available location, with administrative access for the evaluation.

Customers should test what matters to their business: creation of accounts and groups, password management, permitted balance entries, chart and quote behavior, trading history, and integration with their own software.

Clear boundaries make a better long-term project

Server account balances are not the same as bank deposits or transfers. A recorded withdrawal in an MT4 ledger does not by itself pay a client. Likewise, receipt of a price feed does not automatically constitute a liquidity or execution relationship. A professional deployment identifies these dependencies early and confirms external services separately.

Legal and regulatory permissions for brokerage operations depend on the customer's jurisdiction and business structure. The availability and lawful use of third-party software, trademarks and licenses must also be confirmed in the contract; this overview does not represent an official MetaQuotes license offer.

Contact and next steps

To request a configuration, explain the intended hosting location, rental or purchase preference, expected usage, required modules and any integration or branding work. Hi-Tech-Fx can then confirm what is included in the server package and what requires a separate order.
